CS 314 Principles of Programming Languages

Lecture 20: Parallelism and Dependence Analysis

Prof. Zheng Zhang

Rutgers University

November 16, 2018

Class Information

- Homework 7 is released.
- Project 2 deadline will be extended to 11/25 Sunday.

Review: Dependence Test

Given

```
do i_1 = L_1,U_1
  ...
    do i_n = L_n,U_n
      S1 :  A[ f_1( i_1, …, i_n), …, f_m(i_1,…, i_n) ] = ...
      S2 :  …  =  A[ g_1(i_1, …, i_n), …, g_m(i_1, …, i_n) ]
```

Let α & β be a vector of n integers within the ranges of the lower and upper bounds of the n loops.

Does ∃ α, β in the loop iteration space, s.t.

$$f_k(\alpha) = g_k(\beta) \qquad \forall k, 1 \leq k \leq m?$$

Integer Linear Programming (ILP) for Dependence Test

Does ∃ α, β in the loop iteration space, s.t.

$$f_k(\alpha) = g_k(\beta) \qquad \forall k, 1 \le k \le m?$$

```
for (i=1; i<=100; i++)
    for (j=1; j<=100; j++){
        S1: X[i,j] = X[i,j] + Y[i-1, j];
        S2: Y[i,j] = Y[i,j] + X[i, j-1];
    }
```

Consider the two memory references:

S1(α): **X[i_1, j_1]**, S2(β): **X[i_2, j_2-1]**

α: (i_1, j_1)

β: (i_2, j_2)

Access the same memory location →

$i_1 = i_2$

$j_1 = j_2 - 1$

Loop bounds constraint →

$1 <= i_1 <= 100$

$1 <= j_1 <= 100$

$1 <= i_2 <= 100$

$1 <= j_2 <= 100$

Does there exist a solution to this integer linear programming (ILP) problem?

Integer Linear Programming (ILP) for Dependence Test

If we use the matrix vector notation <F_1, f_1, B_1, b_1> and <F_2, f_2, B_2, b_2> for two references at two iterations α: (i_1, j_1) and β: (i_2, j_2)

$i_1 = i_2$
$j_1 = j_2 - 1$
$1 <= i_1 <= 100$
$1 <= j_1 <= 100$
$1 <= i_2 <= 100$
$1 <= j_2 <= 100$

Memory reference **X[i_1, j_1]**

$$\mathbf{F_1} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad f_1 = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} i_1 \\ j_1 \end{bmatrix}$$

Memory reference **X[i_2, j_2-1]**

$$\mathbf{F_1} \begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + f_1 = \mathbf{F_2} \begin{bmatrix} i_2 \\ j_2 \end{bmatrix} + f_2$$

$$\begin{bmatrix} i_1 \\ j_1 \end{bmatrix} = \begin{bmatrix} i_2 \\ j_2 - 1 \end{bmatrix}$$

$$\mathbf{F_2} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad f_2 = \begin{bmatrix} 0 \\ -1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} i_2 \\ j_2 \end{bmatrix} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} = \begin{bmatrix} i_1 \\ j_2 - 1 \end{bmatrix}$$

Integer Linear Programming (ILP) for Dependence Test

If we use the matrix vector notation <F_1, f_1, B_1, b_1> and <F_2, f_2, B_2, b_2> for two references at two iterations α: (i_1, j_1) and β: (i_2, j_2)

$i_1 = i_2$
$j_1 = j_2 - 1$
$1 <= i_1 <= 100$
$1 <= j_1 <= 100$
$1 <= i_2 <= 100$
$1 <= j_2 <= 100$

Loop bounds for ($\mathbf{i_1}$, $\mathbf{j_1}$)

$$B_1 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ -1 & 0 \\ 0 & -1 \end{bmatrix} \quad b_1 = \begin{bmatrix} -1 \\ -1 \\ 100 \\ 100 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \\ -1 & 0 \\ 0 & -1 \end{bmatrix} \begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + \begin{bmatrix} -1 \\ -1 \\ 100 \\ 100 \end{bmatrix} >= \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$B_1 \begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + b_1 >= 0$$

$$B_2 \begin{bmatrix} i_2 \\ j_2 \end{bmatrix} + b_2 >= 0$$

Loop bounds for ($\mathbf{i_2}$, $\mathbf{j_2}$)

$$B_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ -1 & 0 \\ 0 & -1 \end{bmatrix} \quad b_2 = \begin{bmatrix} -1 \\ -1 \\ 100 \\ 100 \end{bmatrix}$$

Putting Everything Together

If we use the matrix vector notation $<F_1, f_1, B_1, b_1>$ and $<F_2, f_2, B_2, b_2>$ for two references at two iterations α: (i_1, j_1) and β: (i_2, j_2)

$$
\begin{aligned}
i_1 &= i_2 \\
j_1 &= j_2 - 1 \\
1 &<= i_1 <= 100 \\
1 &<= j_1 <= 100 \\
1 &<= i_2 <= 100 \\
1 &<= j_2 <= 100
\end{aligned}
\quad \Rightarrow \quad
\begin{aligned}
& \mathbf{F_1} \begin{bmatrix} \mathbf{i_1} \\ \mathbf{j_1} \end{bmatrix} + f_1 = \mathbf{F_2} \begin{bmatrix} \mathbf{i_2} \\ \mathbf{j_2} \end{bmatrix} + f_2 \\
& B_1 \begin{bmatrix} \mathbf{i_1} \\ \mathbf{j_1} \end{bmatrix} + b_1 >= 0 \\
& B_2 \begin{bmatrix} \mathbf{i_2} \\ \mathbf{j_2} \end{bmatrix} + b_2 >= 0
\end{aligned}
$$

$$
\mathbf{F_1} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad f_1 = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \qquad \mathbf{F_2} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad f_2 = \begin{bmatrix} 0 \\ -1 \end{bmatrix}
$$

B_1 , b_1 , B_2 , b_2 **see previous slides**

Review: Parallelizing Affine Loops

Three spaces

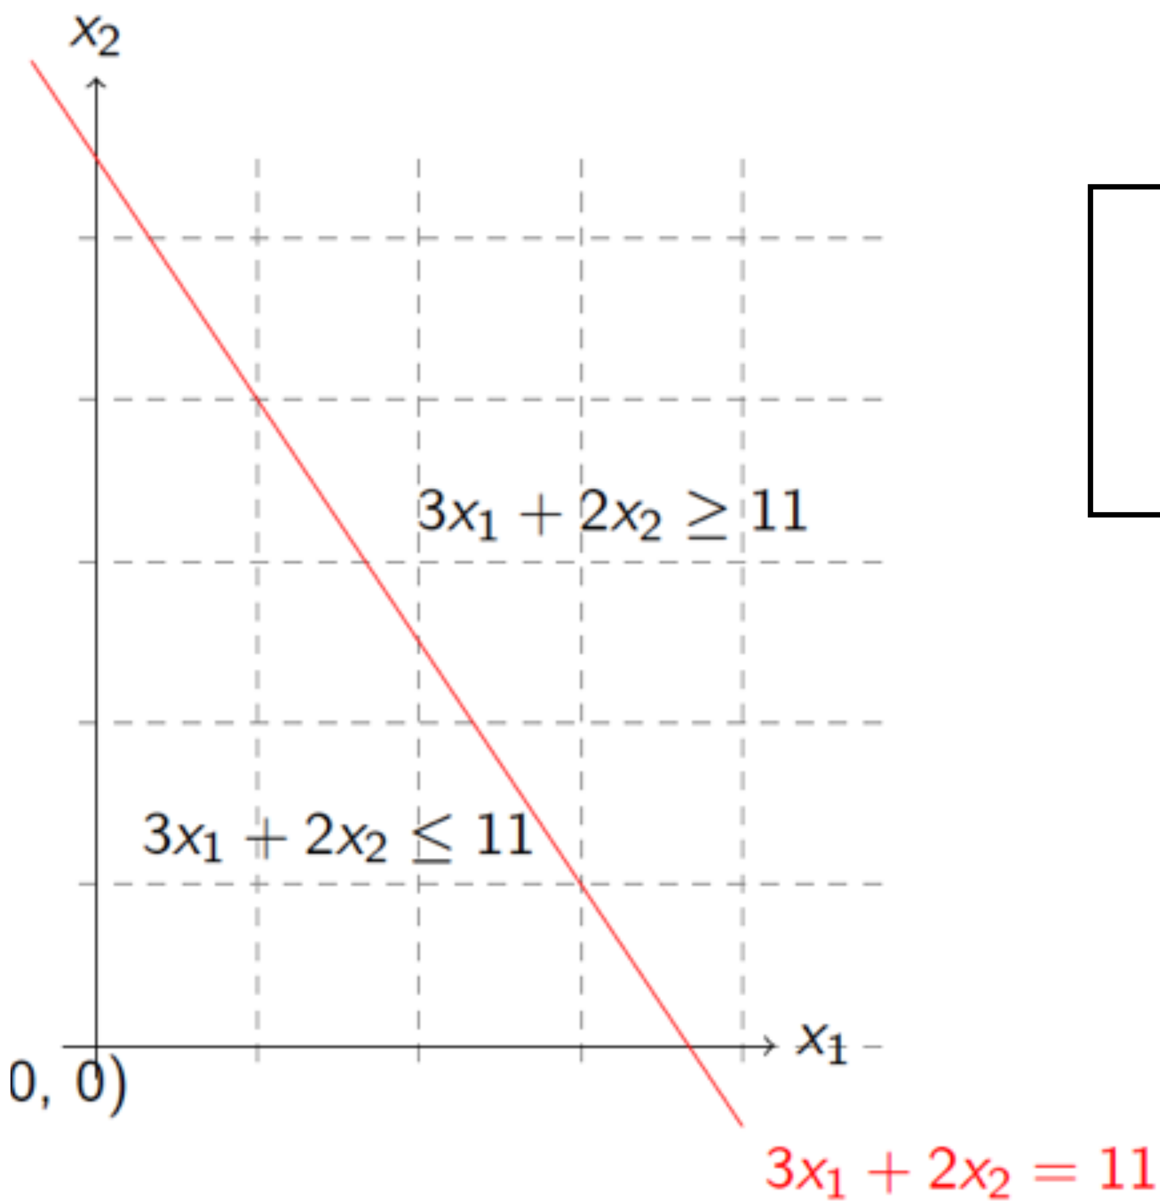
- Iteration space
  - The set of dynamic execution instances
    For instance, the set of value vectors taken by loop indices
  - A *k*-dimensional space for a *k*-level loop nest
- Data space
  - The set of array elements accessed
  - An *n*-dimensional space for an *n*-dimensional array
- Processor space
  - The set of processors in the system
  - In analysis, we may pretend there are unbounded # of virtual processors

Affine Half Space

Definition

An affine half-space of Z^d is defined as the set of points

$$\{ \vec{x} \in Z^d \mid \vec{a} * \vec{x} <= b \}$$



$\vec{a} * \vec{x} = b$ is the hyperplane that divides the d-dimensional space into two half-spaces.

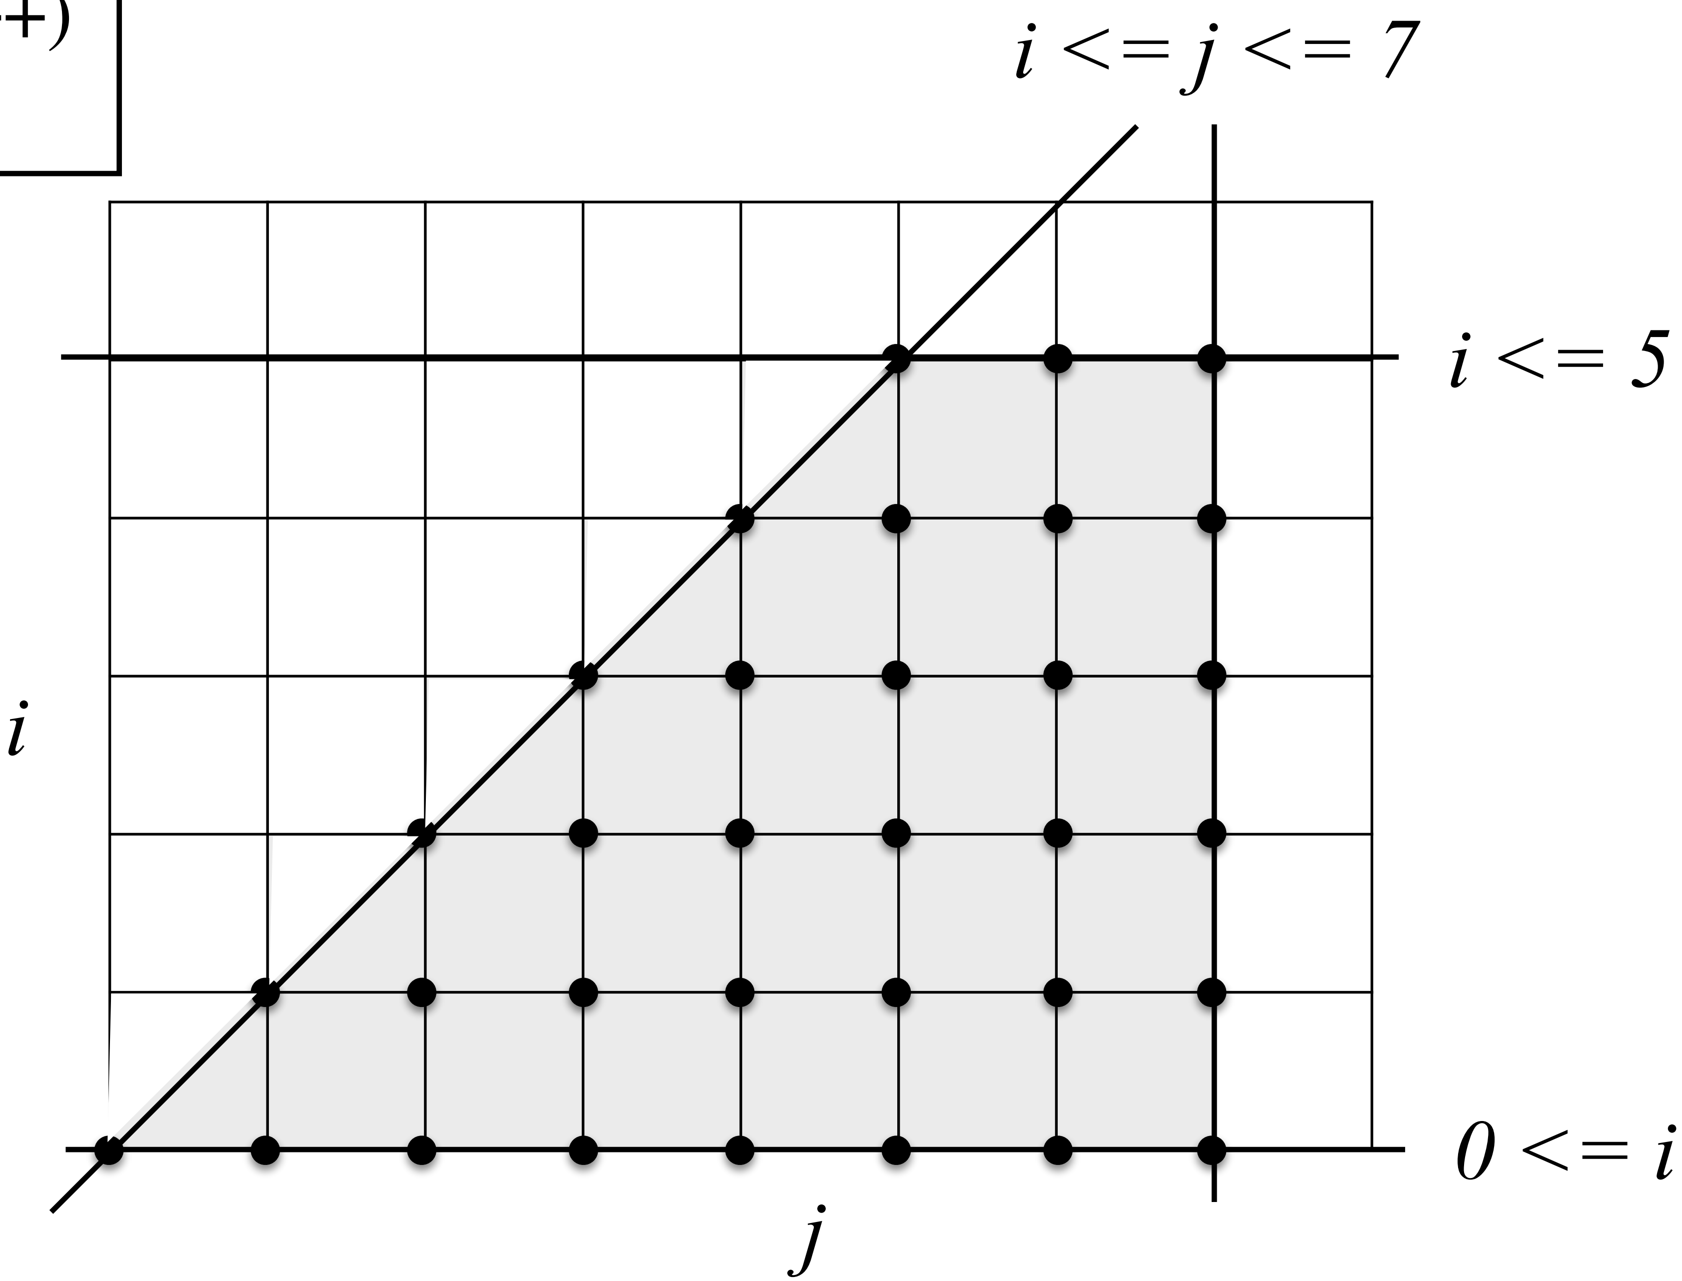
Iteration Space

- Bounded by multiple hyperplanes

```
for (i=0; i<=5; i++)
   for (j=i; j<=7; j++)
      Z[j, i] = 0;
```

$0 <= i <= 5$

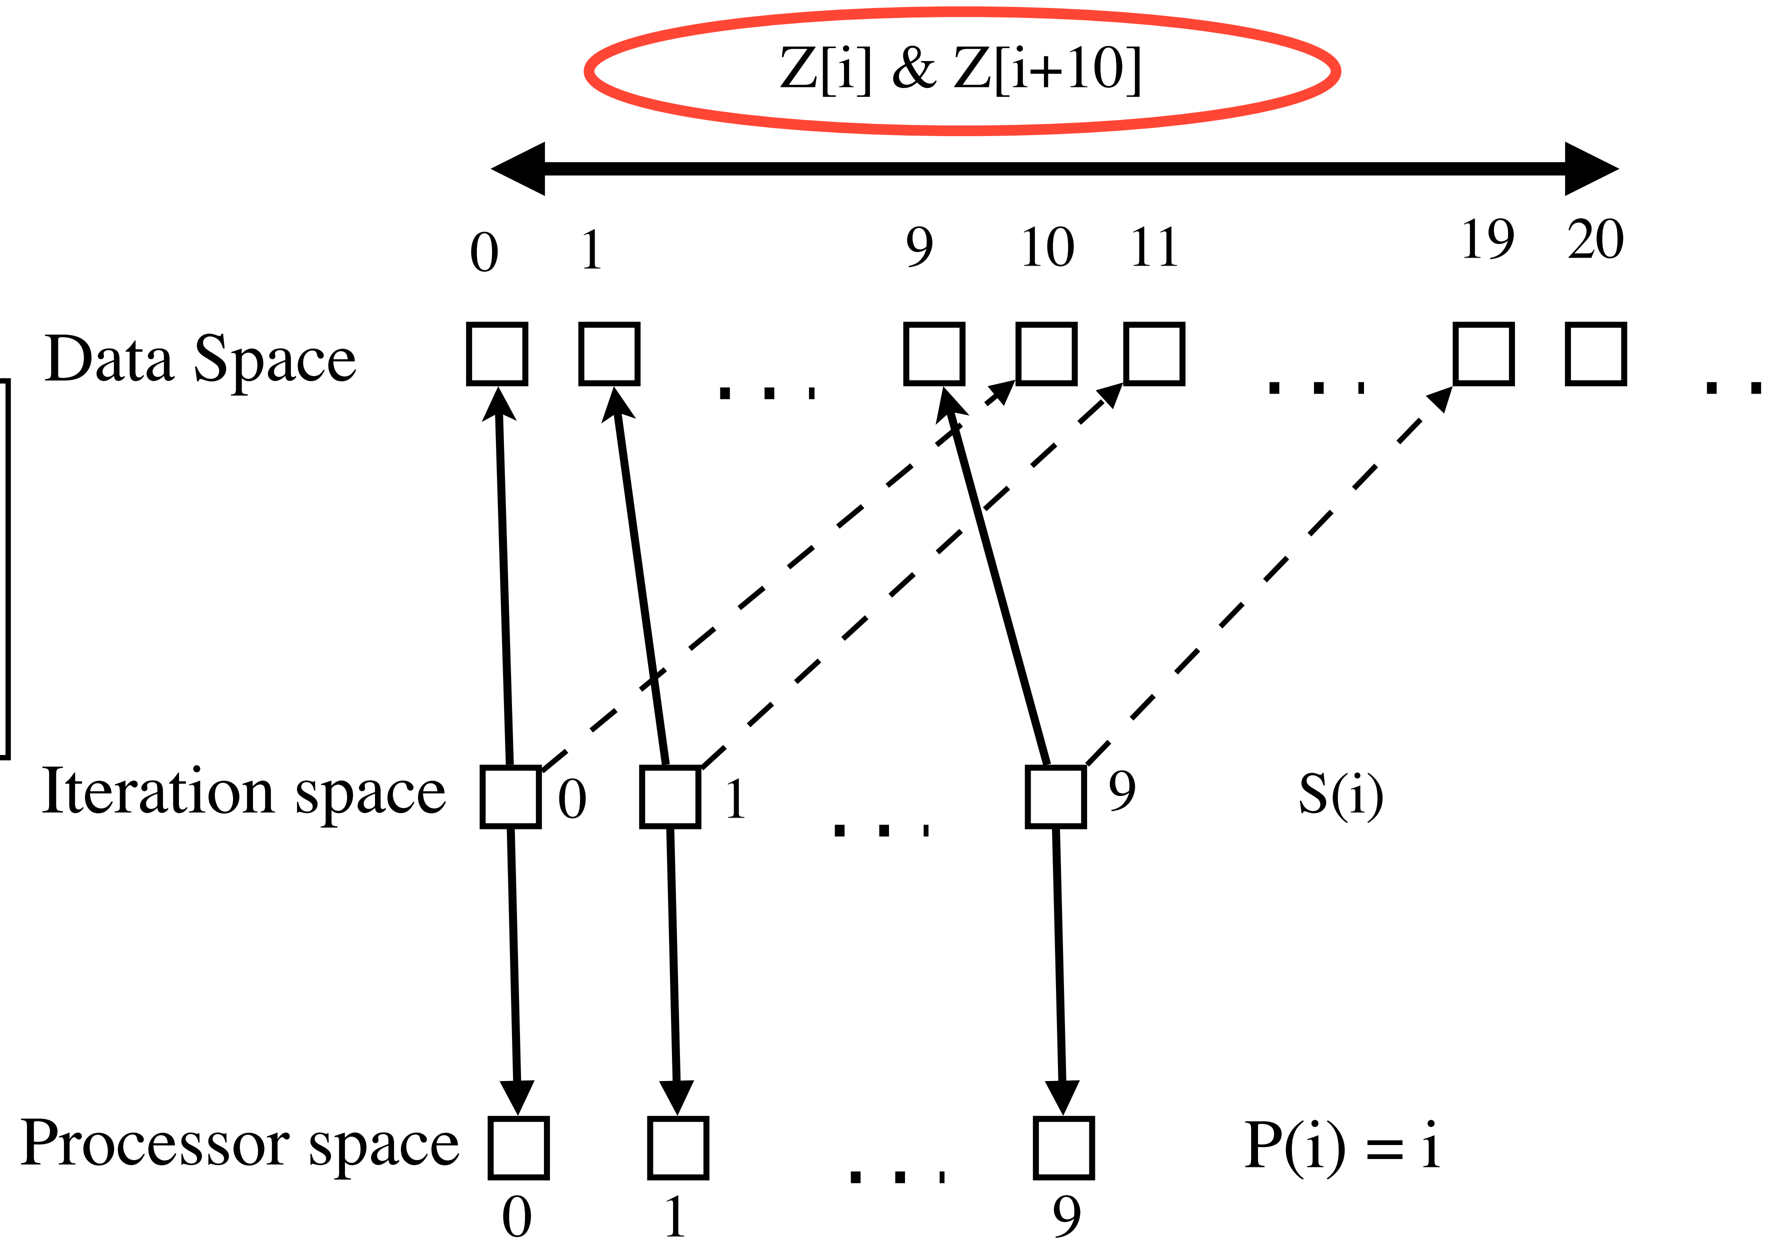
$i <= j <= 7$



Three Spaces

- **Iteration space, data space, and processor space**

```
float Z[100];
for (i=0; i<10; i++)
  S: Z[i+10] = Z[i];
```



Synchronization-free Parallelism

Parallelize an application **without** allowing any *communication* or *synchronization* among (logical) processors.

<u>Example:</u>

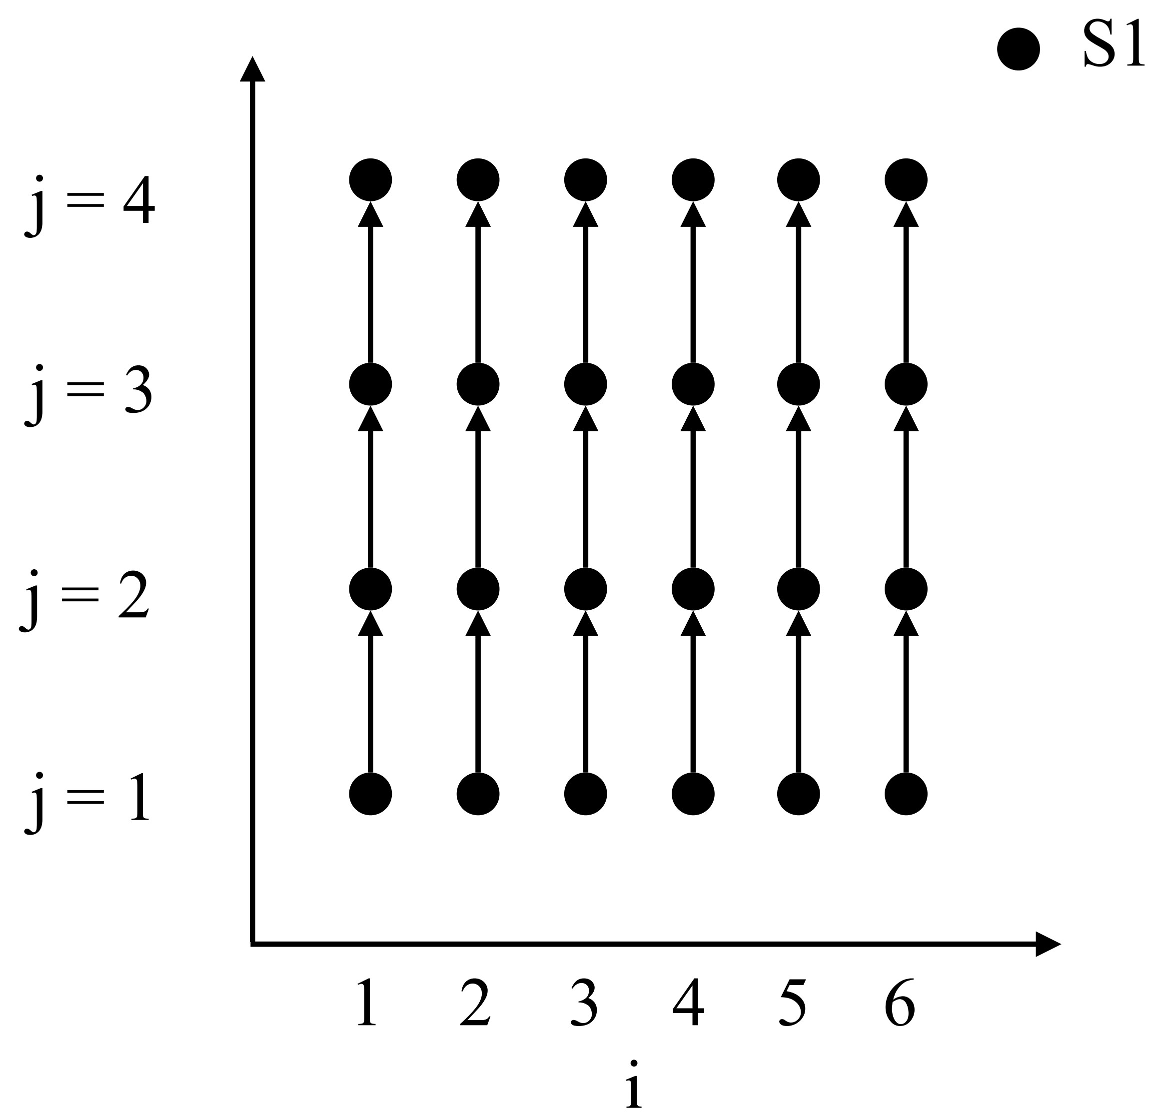
```
do i = 1, N
    do j = 1, N
      S1: A[i, j] = A[i, j - 1]
```

***Write** in $S_1(1,1)$ to **Read** in $S_1(1,2)$*

↓

***Write** in $S_1(i, j)$ to **Read** in $S_1(i, j+1)$*

Dependence from **S1** to **S1**



Synchronization-free Parallelism

Parallelize an application **without** allowing any *communication* or *synchronization* among (logical) processors.

Example:

do i = 1, N
  do j = 1, N
    S_1: A[i, j] = A[i, j - 1]

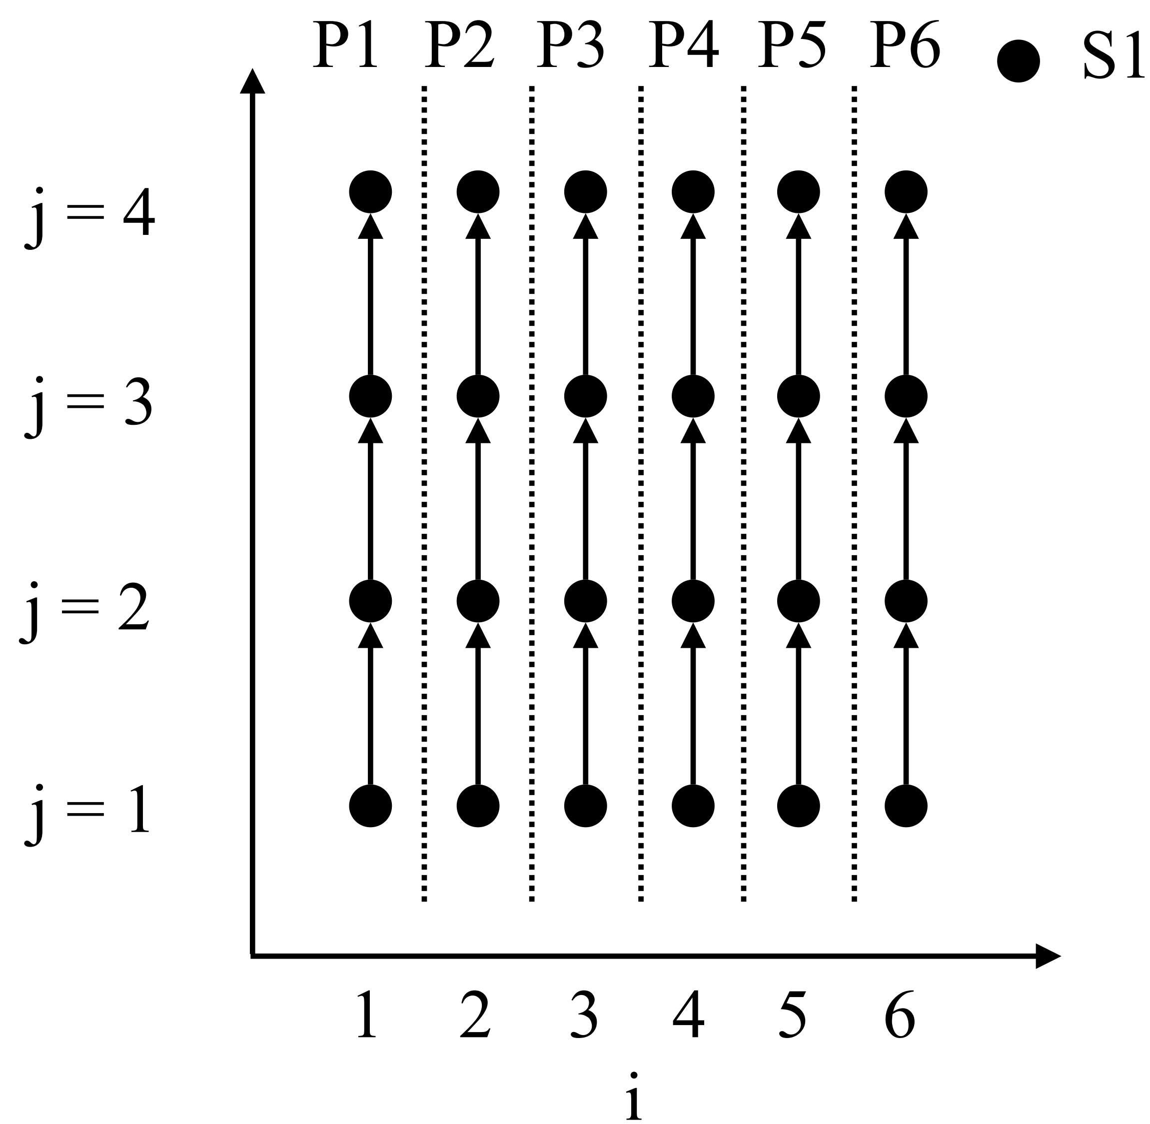
Write *in $S_1(1,1)$ to* ***Read*** *in $S_1(1,2)$*

↓

Write *in $S_1(i, j)$ to* ***Read*** *in $S_1(i, j+1)$*

Dependence from **S1** to **S1**

Communication is limited to the iterations on one processor.



Synchronization-free Parallelism

Parallelize an application **without** allowing any *communication* or *synchronization* among (logical) processors.

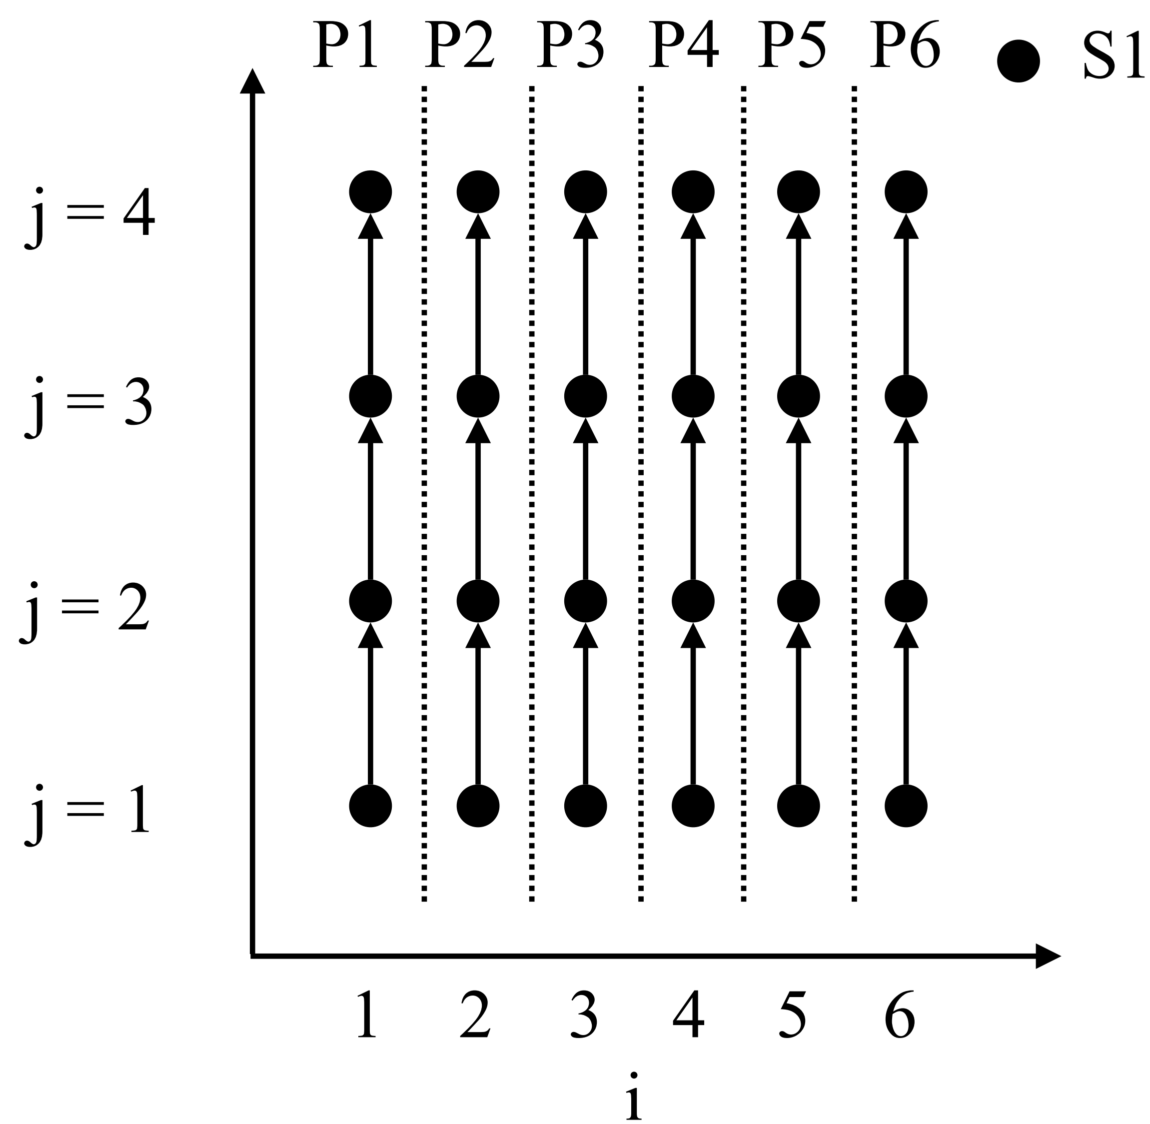
Example:

```
do i = 1, N
    do j = 1, N
      S1: A[i, j] = A[i, j - 1]
```

Write *in $S_1(1,1)$ to* ***Read*** *in $S_1(1,2)$*

↓

Write *in $S_1(i, j)$ to* ***Read*** *in $S_1(i, j+1)$*



Which loop can be parallelized?
The "i" loop or the "j" loop?

Answer: the "i" loop

Synchronization-free Parallelism

Parallelize an application **without** allowing any *communication* or *synchronization* among (logical) processors.

Example 1:

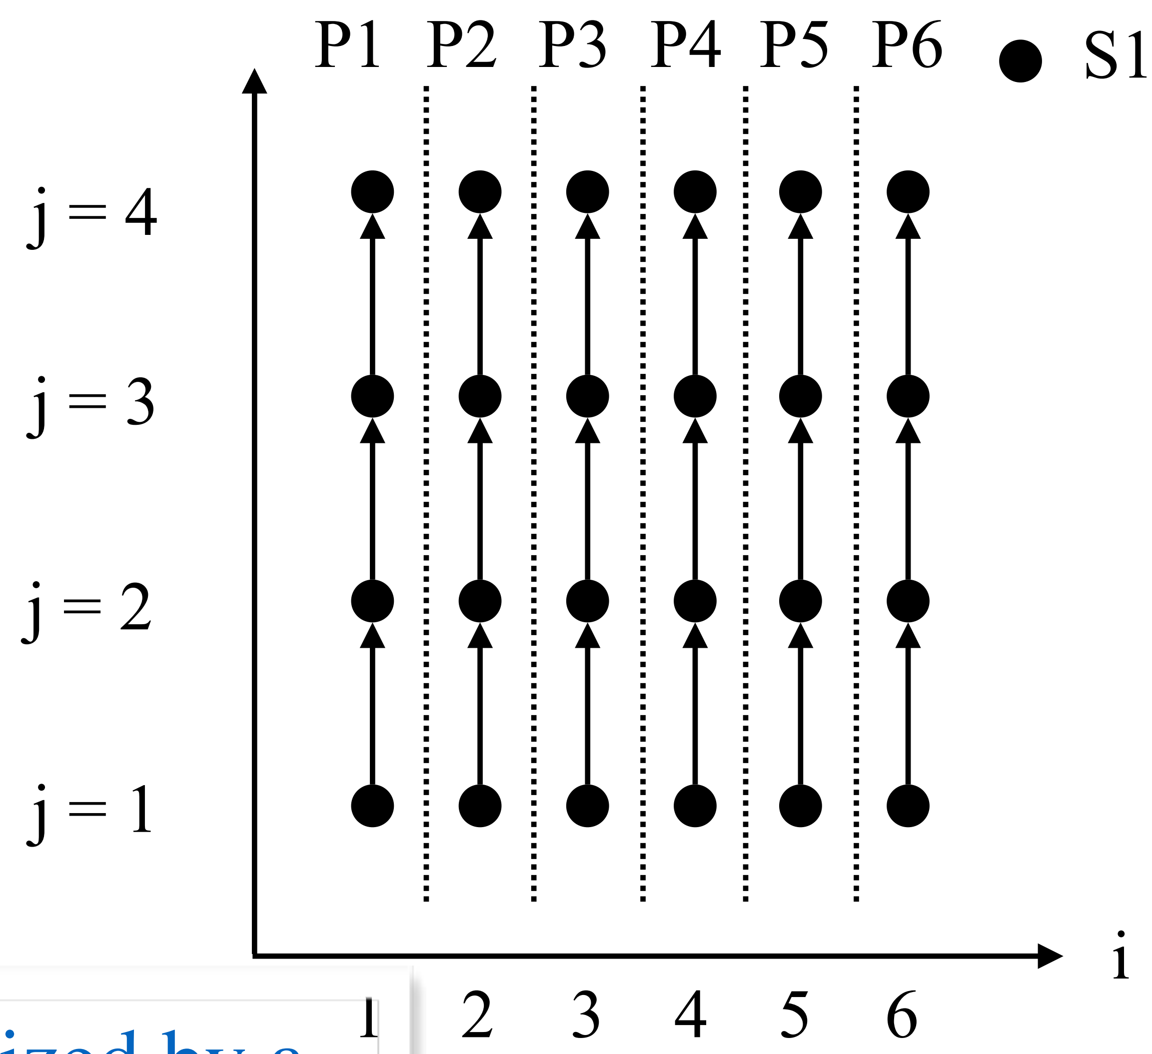
```
doall i = 1, N
    do j = 1, N
        S1: A[i, j] = A[i, j - 1]
```

Write *in S_1(1,1) to* ***Read*** *in S_1(1,2)*

↓

Write *in S_1(i, j) to* ***Read*** *in S_1(i, j+1)*

Dependence from **S1**(1,1) to **S2**(1,2)



The dependence chain is characterized by a **hyperplane**. In this case it is "i = constant".

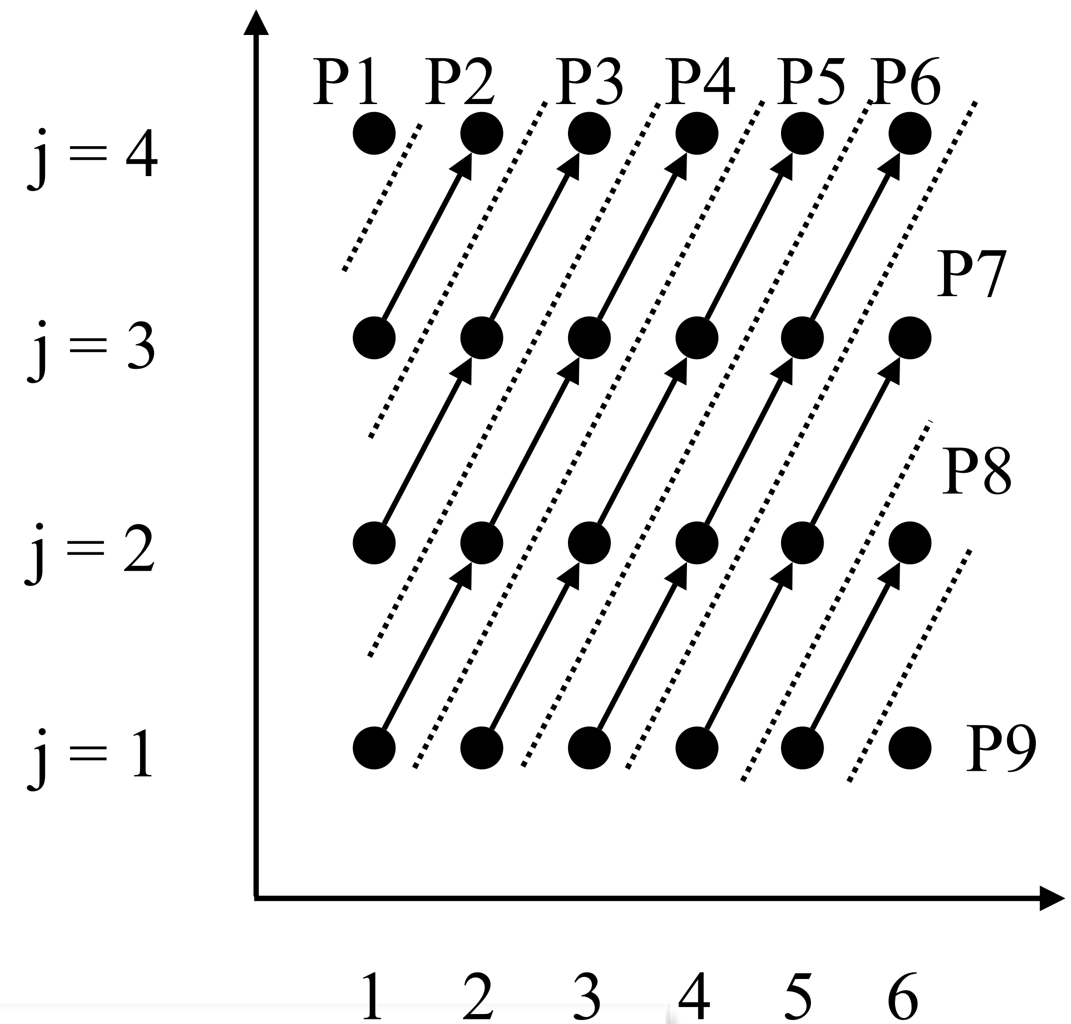
Synchronization-free Parallelism

Parallelize an application **without** allowing any *communication* or *synchronization* among (logical) processors.

<u>Example 2</u>:

```
do i = 1, N
    do j = 1, N
    S1: A[i, j] = A[i - 1, j - 1]
```

Dependence from **S1**(i,j) to **S1**(i+1,j+1)



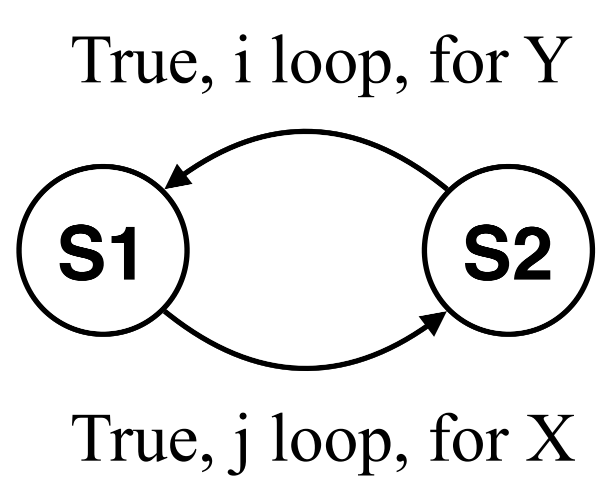
The dependence chain is characterized by a **hyperplane**. In this case it is "j - i + constant = 0".

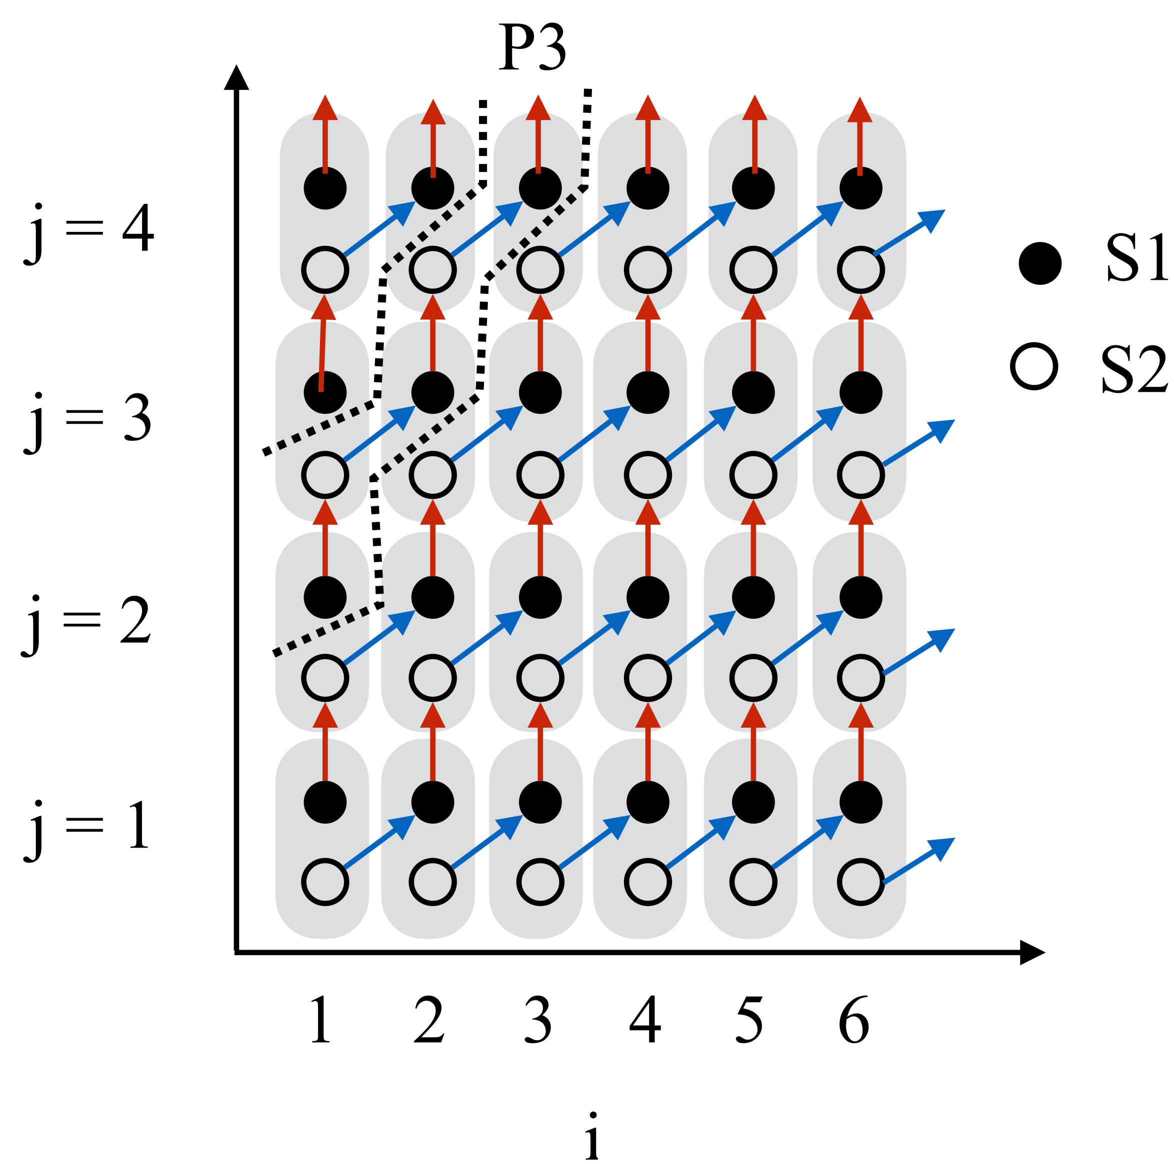
Synchronization-free Parallelism

Parallelize an application **without** allowing any *communication* or *synchronization* among (logical) processors.

<u>Example 3</u>:

```
for (i=1; i<=100; i++)
    for (j=1; j<=100; j++){
        S1: X[i,j] = X[i,j] + Y[i-1, j];
        S2: Y[i,j] = Y[i,j] + X[i, j-1];
    }
```





Dependence from **S1**(1,1) to **S2**(1,2)

Dependence from **S2**(1,1) to **S1**(2,1)

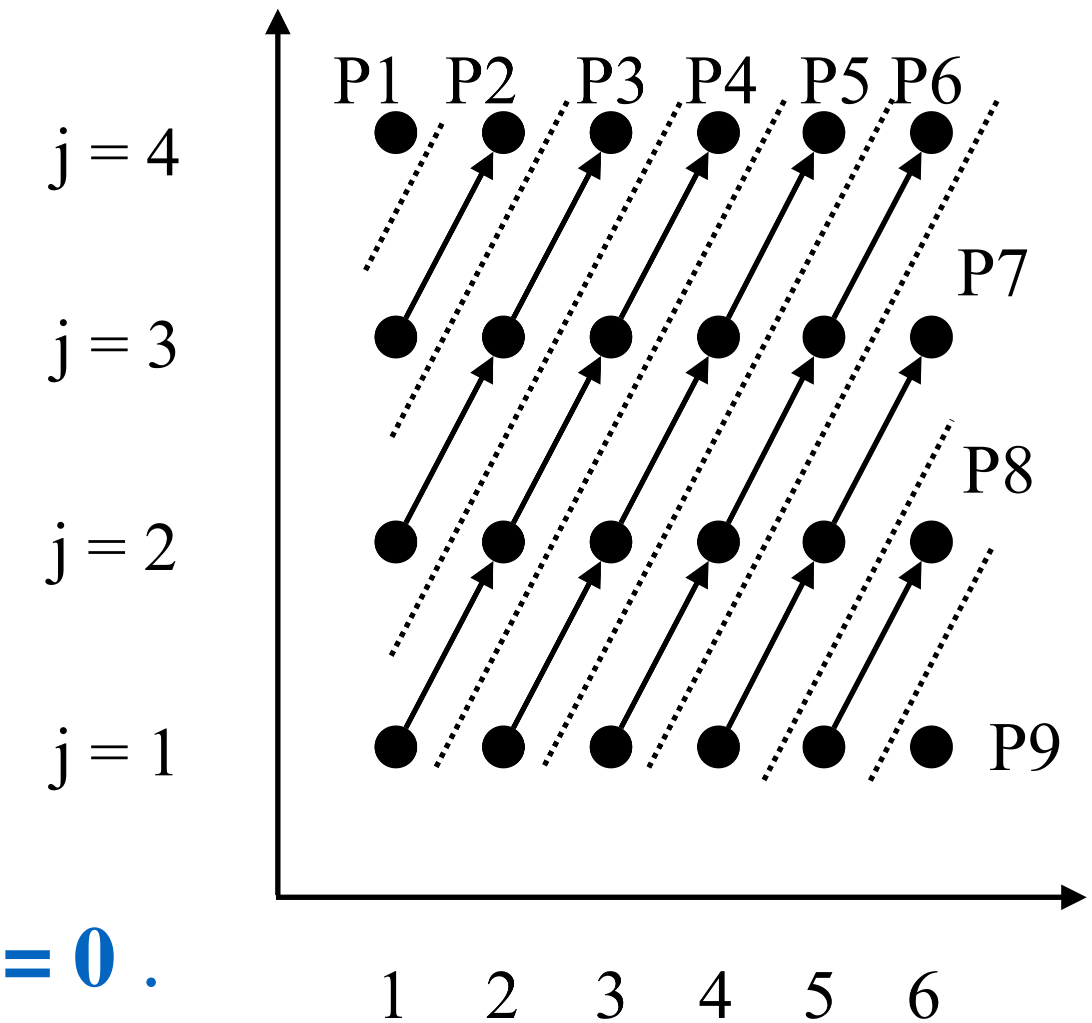
Dependence and Parallelization

- Dependence chain in affine loops modeled as a hyperplane.
- Iterations along the same hyperplane must execute sequentially.
- **Iterations on different hyperplanes can execute in parallel.**

Example:

```
do i = 1, N
    do j = 1, N
    S1: A[i, j] = A[i - 1, j - 1]
```

Dependence from **S1**(i,j) to **S1**(i+1,j+1)



The hyperplane is **j - i + constant = 0** .

Processing Space: Affine Partition Schedule

- Map an iteration to a processor using < **C**, d >

  C is a *n by m* matrix

  - m = d (the loop level)
  - n is the dimension of the processor grid

  $\vec{d}$ is a n-element constant vector

  $\vec{p}$ = C $\vec{x}$ + $\vec{d}$, where $\vec{x}$ is an iteration vector

Processing Space: Affine Partition Schedule

- Map an iteration to a processor using **< C**, d **>**

$$\vec{p} = \mathbf{C}\,\vec{x} + \vec{d}, \textbf{ where } \vec{x} \textbf{ is an iteration vector}$$

- Example

```
for (i=1; i<=N; i++)
    S: Y[i] = Z[i];
```

C = [1], **d** = [0]

$\vec{p}(\ S(i)\ ) = 1*i + 0$

$= i$

Map iteration **i** to Processor **i**

Synchronization-free Parallelism

- Two memory references as $<F_1, f_1, B_1, b_1>$ and $<F_2, f_2, B_2, b_2>$ such that $<F_2, f_2, B_2, b_2>$ at iteration α: (i_1, j_1) depends on $<F_1, f_1, B_1, b_1>$ at iteration β: (i_2, j_2)
  - $\mathbf{F_1}$ is a matrix and f_1 is a vector.
    The affine memory access index is $\mathbf{F_1} * \alpha + f_1$.
  - $\mathbf{B_1}$ is a matrix and b_1 is a vector.
    The affine loop bounds can be expressed as $\mathbf{B_1} * \alpha + b_1 >= 0$
- Let $<\mathbf{C_1}, \mathbf{d_1}>$ and $<\mathbf{C_2}, \mathbf{d_2}>$ represent the respective processor schedule, to have synchronization-free parallelism,

$$\mathbf{C_1 * \alpha + d_1 = C_2 * \beta + d_2}$$

These two memory references must execute on the same processor (sequentially).

Synchronization-free Parallelism

- Two memory references as $<F_1, f_1, B_1, b_1>$ and $<F_2, f_2, B_2, b_2>$ such that $<F_2, f_2, B_2, b_2>$ at iteration (i_1, j_1) depends on $<F_1, f_1, B_1, b_1>$ at iteration (i_2, j_2)

```
for (i=1; i<=100; i++)
    for (j=1; j<=100; j++){
        S1: X[i,j] = X[i,j] + Y[i-1, j];
        S2: Y[i,j] = Y[i,j] + X[i, j-1];
    }
```

$$\mathbf{F_1}\begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + f_1 = \mathbf{F_2}\begin{bmatrix} i_2 \\ j_2 \end{bmatrix} + f_2$$

$$B_1\begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + b_1 >= 0$$

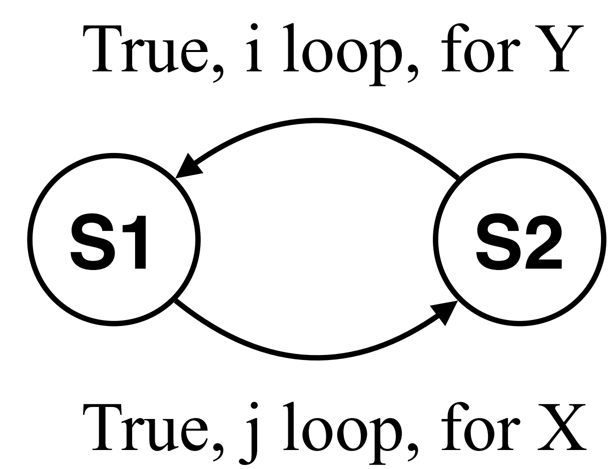
$$B_2\begin{bmatrix} i_2 \\ j_2 \end{bmatrix} + b_2 >= 0$$

- We want to find processor schedule $\mathbf{<C_1, d_1>}$ and $\mathbf{<C_2, d_2>}$ such that

$$[\, \mathbf{C_{11}}\ \mathbf{C_{12}} \,]\begin{bmatrix} \mathbf{i_1} \\ \mathbf{j_1} \end{bmatrix} + [\, \mathbf{d_1} \,] = [\, \mathbf{C_{21}}\ \mathbf{C_{22}} \,]\begin{bmatrix} \mathbf{i_2} \\ \mathbf{j_2} \end{bmatrix} + [\, \mathbf{d_2} \,]$$

Synchronization-free Parallelism

```
for (i=1; i<=100; i++)
   for (j=1; j<=100; j++){
      S1: X[i,j] = X[i,j] + Y[i-1, j];
      S2: Y[i,j] = Y[i,j] + X[i, j-1];
   }
```



$1 <= i_1 <= 100, \quad 1 <= j_1 <= 100,$
$1 <= i_2 <= 100, \quad 1 <= j_2 <= 100,$
$i_1 = i_2, \quad j_1 = j_2 - 1,$

$$[C_{11}\ C_{12}]\begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + [d_1] = [C_{11}\ C_{12}]\begin{bmatrix} i_2 \\ j_2 \end{bmatrix} + [d_2]$$

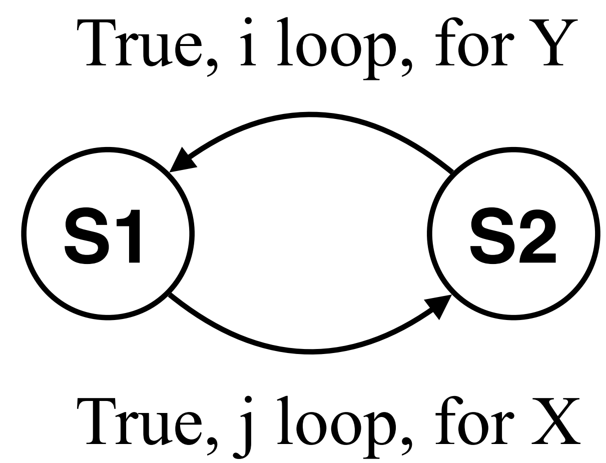
$$C_{11} - C_{21} = 0$$
$$C_{12} - C_{22} = 0$$
$$d_1 - d_2 - C_{22} = 0$$

$$[C_{11} - C_{21}, C_{12} - C_{22}]\begin{bmatrix} i_1 \\ j_1 \end{bmatrix} + [d_1 - d_2 - C_{22}] = 0$$

S1 to S2 dependence

Synchronization-free Parallelism

```
for (i=1; i<=100; i++)
    for (j=1; j<=100; j++){
        S1: X[i,j] = X[i,j] + Y[i-1 , j];
        S2: Y[i,j] = Y[i,j] + X[i, j-1];
    }
```



$1 <= i_3 <= 100, \quad 1 <= j_3 <= 100,$

$1 <= i_4 <= 100, \quad 1 <= j_3 <= 100,$

$i_3 - 1 = i_4, \quad j_3 = j_4,$

$$[C_{11}\ C_{12}]\begin{bmatrix} i_3 \\ j_3 \end{bmatrix} + [d_1] = [C_{11}\ C_{12}]\begin{bmatrix} i_4 \\ j_4 \end{bmatrix} + [d_2]$$

$$[C_{11} - C_{21}, C_{12} - C_{22}]\begin{bmatrix} i_3 \\ j_3 \end{bmatrix} + [d_1 - d_2 + C_{21}] = 0$$

S2 to S1 dependence

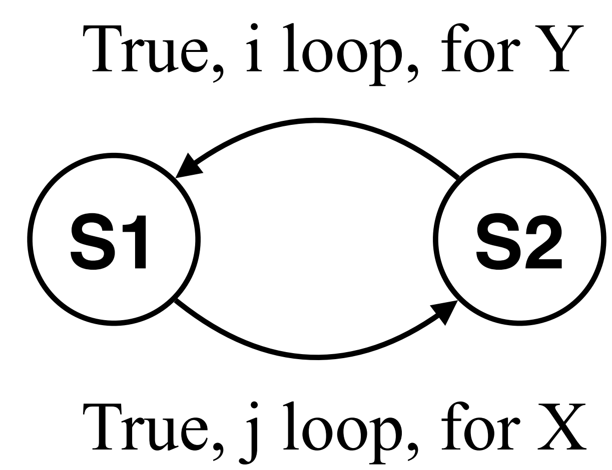
$$C_{11} - C_{21} = 0$$

$$C_{12} - C_{22} = 0$$

$$d_1 - d_2 + C_{21} = 0$$

Synchronization-free Parallelism

```
for (i=1; i<=100; i++)
    for (j=1; j<=100; j++){
        S1: X[i,j] = X[i,j] + Y[i-1 , j];
        S2: Y[i,j] = Y[i,j] + X[i, j-1];
    }
```



S1 to S2 dependence

$$C_{11} - C_{21} = 0$$

$$C_{12} - C_{22} = 0$$

$$d_1 - d_2 - C_{22} = 0$$

S2 to S1 dependence

$$C_{11} - C_{21} = 0$$

$$C_{12} - C_{22} = 0$$

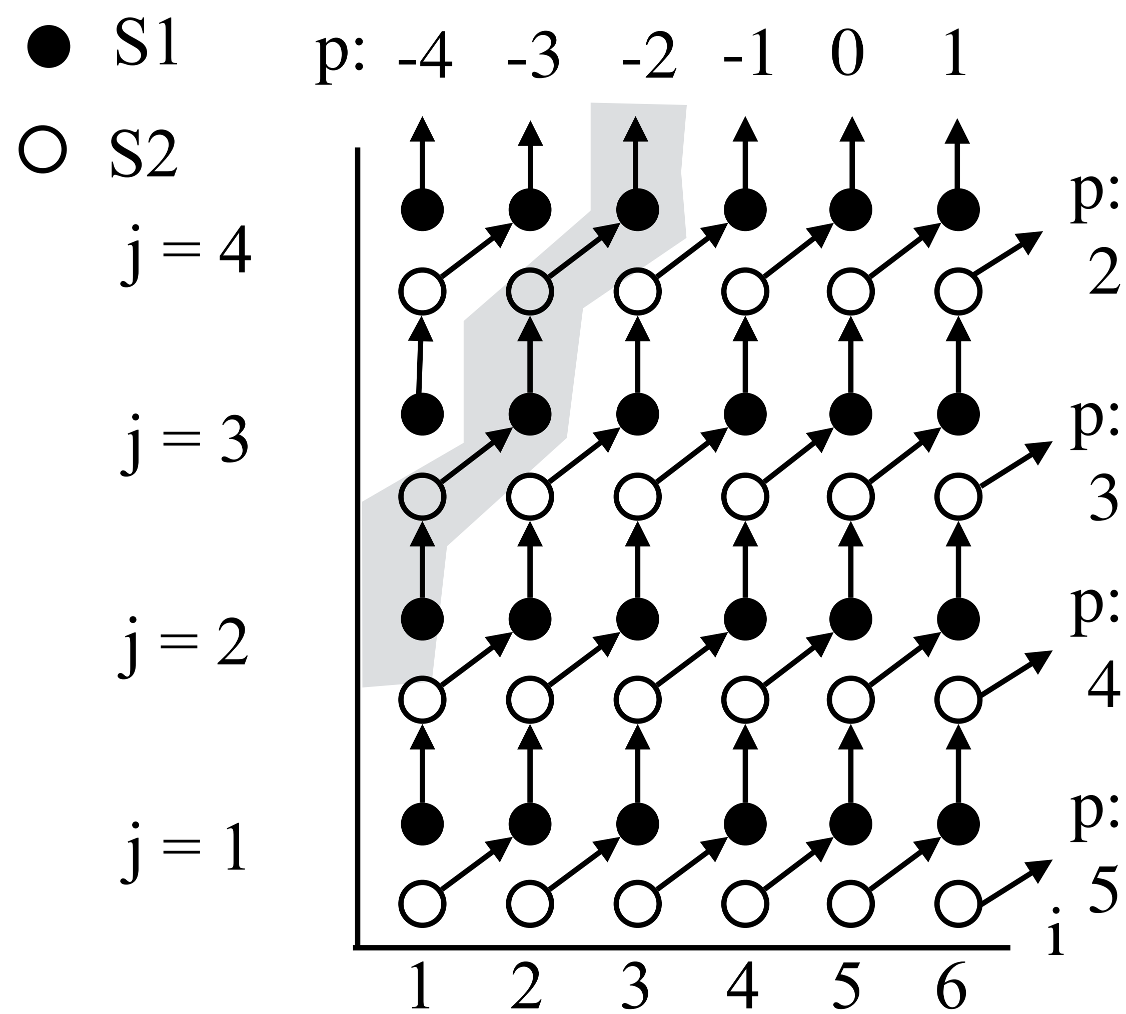
$$d_1 - d_2 + C_{21} = 0$$

$$C_{11} = C_{21} = -C_{22} = -C_{12} = d_2 - d_1$$

Synchronization-free Parallelism

Example:

```
for (i=1; i<=100; i++)
    for (j=1; j<=100; j++){
        S1: X[i,j] = X[i,j] + Y[i-1, j];
        S2: Y[i,j] = Y[i,j] + X[i, j-1];
    }
```



$$\mathbf{C_{11} = C_{21} = -C_{22} = -C_{12} = d_2 - d_1}$$

One Potential Solution:

Affine schedule for S1, p(S1): $[C_{11}\ C_{12}] = [1\ -1]$, $d_1 = -1$

i.e. (i, j) iteration of S1 to processor $p = i - j - 1$;

Affine schedule for S2, p(S2): $[C_{21}\ C_{22}] = [1\ -1]$, $d_2 = 0$

i.e. (i, j) iteration of S2 to processor $p = i - j$.

Code Generation

```
for (i=1; i<=6; i++)
  for (j=1; j<=4; j++){
    X[i,j] = X[i,j] + Y[i-1, j];    /* S1 */
    Y[i,j] = Y[i,j] + X[i, j-1];    /* S2 */
  }
```

S1(i, j): processor p = i-j-1;
S2(i, j): processor p = i-j.

```
forall (p=-4; p<=5; p++)
  for (i=1; i<=6; i++)
    for (j=1; j<=4; j++){
      if (p== i-j-1)
        X[i,j] = X[i,j] + Y[i-1, j];    /* S1 */
      if (p== i-j)
        Y[i,j] = Y[i,j] + X[i, j-1];    /* S2 */
  }
```

- Step 1: find processor ID ranges
  - S1: $-4 <= p <= 4$
  - S2: $-3 <= p <= 5$
  - Union: $-4 <= p <= 5$
- Step 2: generate code

Naive Code Generation

```
forall (p=-4; p<=5; p++)
    for (i=1; i<=6; i++)
        for (j=1; j<=4; j++){
            if (p== i-j-1)
                X[i,j] = X[i,j] + Y[i-1, j];    /* S1 */
            if (p== i-j)
                Y[i,j] = Y[i,j] + X[i, j-1];    /* S2 */
        }
```

What are the issues with this code?

- Idle iterations
- Lots of tests in loop body

Remove Idle Iterations

Some iterations have idle operations

For example, when p=-4, only 1 of the 24 iterations has useful operations, i = 1 , j =4 .

```
forall (p=-4; p<=5; p++)
   for (i=1; i<=6; i++)
      for (j=1; j<=4; j++){
         if (p== i-j-1)
            X[i,j] = X[i,j] + Y[i-1, j];    /* S1 */
         if (p== i-j)
            Y[i,j] = Y[i,j] + X[i, j-1];    /* S2 */
      }
```

Make Loop Bounds Tighter

-4 <= p <= 5
1<= i <= 6
1<= j <= 4
i-p-1=j

-4 <= p <= 5
1<= i <= 6
1<= j <= 4
i-p=j

Fourier-Motzkin Elimination

S1

j:	i-p-1<= j <= i-p-1
	1<=j <= 4
i:	p+2<=i <= p+5 ← **Eliminate j**
	1<=i <= 6
p:	-4<= p<= 4 ← **Eliminate i**

j = i - p - 1
1 <= i - p - 1 <= 4
p + 1 + 1 <= i <= 4 + p + 1
p + 2 <= i <= p + 5

S2

j:	i-p<=j <= i-p
	1<=j <=4
i:	p+1<=i <= 4+p
	1<=i <=6
p:	-3<= p <= 5

Make Loop Bounds Tighter

S1

j:	i-p-1<= j <= i-p-1
	1<=j <= 4
i:	p+2<=i <= p+5
	1<=i <= 6
p:	-4<= p<= 4

S2

j:	i-p<=j <= i-p
	1<=j <=4
i:	p+1<=i <= 4+p
	1<=i <=6
p:	-3<= p <= 5

Union result:

j:	i-p-1<=j <= i-p
	1<=j <=4
i:	p+1<=i <= 5+p
	1<=i <=6
p:	-4<= p <= 5

Make Loop Bounds Tighter

```
forall (p=-4; p<=5; p++)
   for (i=1; i<=6; i++)
      for (j=1; j<=4; j++){
         if (p== i-j-1)
            X[i,j] = X[i,j] + Y[i-1, j];    /* S1 */
         if (p== i-j)
            Y[i,j] = Y[i,j] + X[i, j-1];    /* S2 */
      }
```

Union result:

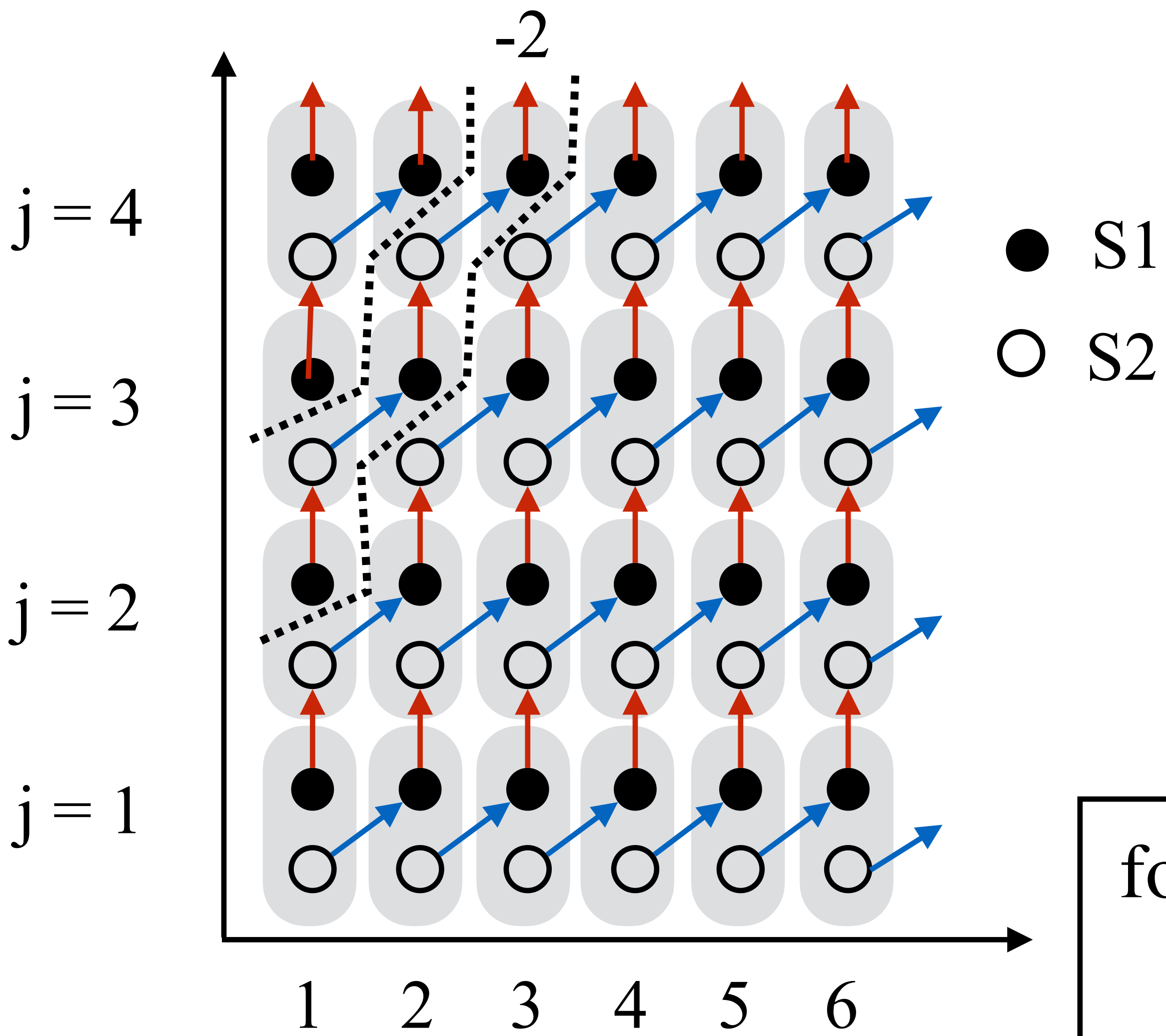
j: i-p-1<=j <= i-p
1<=j <=4

i: **p+1**<=i <= 5+p
1<=i <=6

p: -4<= p <= 5

```
for (p=-4; p<=5; p++)
   for (i=max(1,p+1); i<=min(6,5+p); i++)
      for (j=max(1,i-p-1); j<=min(4,i-p); j++){
         if (p== i-j-1)
            X[i,j] = X[i,j] + Y[i-1, j];    /* S1 */
         if (p== i-j)
            Y[i,j] = Y[i,j] + X[i, j-1];    /* S2 */
      }
```

Make Loop Bounds Tighter



When p = -2,

i: [1, 3]

j: [i+1, min(4, i+2)]

```
for (p=-4; p<=5; p++)
    for (i=max(1,p+1); i<=min(6,5+p); i++)
        for (j=max(1,i-p-1); j<=min(4, i-p); j++)
